### Contenido

### System Identification

**Preliminaries** 

Non-parametric identification in the frequency domain

Non-parametric closed-loop identification in the frequency domain Parametric Identification

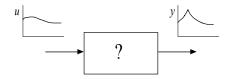

### Loop-Shaping

Open-loop vs closed-loop specifications

**Compensators** 

Non-parametric identification in the frequency domain Non-parametric closed-loop identification in the frequency domain Parametric Identification

## Problem setup

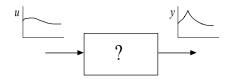

#### Elements

- 1. Unknown process with at least one input and one output
- 2. Actuator to introduce an user-designed input
- 3. Sensor to measure corresponding output

Non-parametric identification in the frequency domain Non-parametric closed-loop identification in the frequency domain Parametric Identification

## Problem setup

#### Elements

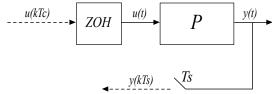

- 1. Unknown process with at least one input and one output
- 2. Actuator to introduce an user-designed input
- 3. Sensor to measure corresponding output

#### Goals

- 1. Determine a model using input/output experimental data
- 2. In the form of a set of equations
- 3. Or in the form of a characteristic response

Non-parametric identification in the frequency domain Non-parametric closed-loop identification in the frequency domain Parametric Identification

## Problem setup

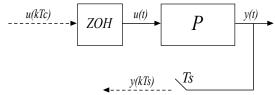

### **Assumptions**

- 1. Continuous-time LTI and (stable) process
- 2. Arbitrary sampling frequency for sensor and actuator
- 3. Strictly proper transfer function without non-minimun phase zeros

Non-parametric identification in the frequency domain Non-parametric closed-loop identification in the frequency domain Parametric Identification

## Problem setup

### **Assumptions**

- 1. Continuous-time LTI and (stable) process
- 2. Arbitrary sampling frequency for sensor and actuator
- 3. Strictly proper transfer function without non-minimun phase zeros

## Challenges

- 1. Design a set of inputs u to characterize P based on outputs y
- Design a processing routine to characterize P based on input/output data

Preliminaries

Non-parametric identification in the frequency domain

Non-parametric closed-loop identification in the frequency domain Parametric Identification

### System Identification

**Preliminaries** 

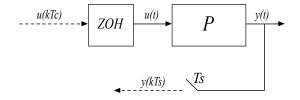

Non-parametric identification in the frequency domain

Non-parametric closed-loop identification in the frequency domain Parametric Identification

Loop-Shaping

Open-loop vs closed-loop specifications

## Problem setup

#### Goals

- 1. Obtain an estimate of the frequency response  $\hat{G}(e^{j\omega})$
- 2. Obtain the coherence spectrum  $\kappa$

Non-parametric identification in the frequency domain

Non-parametric closed-loop identification in the frequency domain Parametric Identification

# Input selection

## Typical signals

- 1. Zero function
- 2. Step function
- 3. Sinusoidal
- 4. Periodic signals: sum of sinusoids
- 5. Pseudo-random binary sequences (PRBS)

Non-parametric identification in the frequency domain

Non-parametric closed-loop identification in the frequency domain Parametric Identification

# Input selection

## Typical signals

- 1. Zero function
- 2. Step function
- 3. Sinusoidal
- 4. Periodic signals: sum of sinusoids
- 5. Pseudo-random binary sequences (PRBS)

## Requirements

- 1. Persistence of excitation (p.e.)
- Sufficient energy

Non-parametric identification in the frequency domain

Non-parametric closed-loop identification in the frequency domain

Parametric Identification

# Input selection

## Typical signals

- 1. Zero function
- 2. Step function
- 3. Sinusoidal
- 4. Periodic signals: sum of sinusoids
- 5. Pseudo-random binary sequences (PRBS)

### Requirements

- 1. Persistence of excitation (p.e.)
- 2. Sufficient energy

#### Winners

- 1. Periodic function: gives estimate of bandwidth
- 2. PRBS of period M: p.e. of order M with white noise-like spectrum

#### System Identification Loop-Shaping

Preliminaries

Non-parametric identification in the frequency domain

Non-parametric closed-loop identification in the frequency domain Parametric Identification

# **Filtering**

#### **Artifacts**

- 1. Drifts
- 2. Grid noise
- 3. Measurement noise

Non-parametric closed-loop identification in the frequency domain Parametric Identification

## **Filtering**

#### **Artifacts**

- 1. Drifts
- 2. Grid noise
- 3. Measurement noise

## **Filtering**

- 1. Direct detrending on the identification data
- 2. Time-domain average exploiting periodic nature of input:
  - 2.1 Separate data into several chunks of length equal to period of input
  - 2.2 Perform direct averaging to obtain smoothed data
- 3. Smoothing in the frequency domain (next slide)

Parametric Identification

Non-parametric identification in the frequency domain

Non-parametric closed-loop identification in the frequency domain

**Filtering** 

#### **Artifacts**

- 1. Drifts
- 2. Grid noise
- 3. Measurement noise

### **Filtering**

- 1. Direct detrending on the identification data
- 2. Time-domain average exploiting periodic nature of input:
  - 2.1 Separate data into several chunks of length equal to period of input
  - 2.2 Perform direct averaging to obtain smoothed data
- 3. Smoothing in the frequency domain (next slide)

## Input design revisited

- 1. Construct a PRBS of length M
- 2. Append several periods to obtain input

Non-parametric identification in the frequency domain

Non-parametric closed-loop identification in the frequency domain

Parametric Identification

# Spectral leakage

#### **Problem**

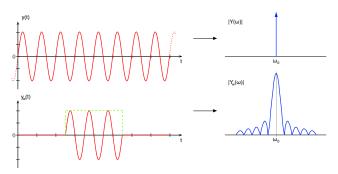

- 1. Real signals have finite length
- 2. Periodicity assumed in DFT depends on sampling
- 3. Non-integer periods lead to inaccurate estimates

Non-parametric closed-loop identification in the frequency domain Parametric Identification

# Spectral leakage

#### **Problem**

- 1. Real signals have finite length
- 2. Periodicity assumed in DFT depends on sampling
- 3. Non-integer periods lead to inaccurate estimates

Non-parametric identification in the frequency domain

Non-parametric closed-loop identification in the frequency domain

Parametric Identification

# Spectral leakage

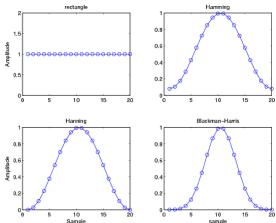

Solution Windowing of signals: non-square window function to improve spectral properties

Non-parametric closed-loop identification in the frequency domain Parametric Identification

## Spectral leakage

# Solution

Windowing of signals: non-square window function to improve spectral properties

Non-parametric closed-loop identification in the frequency domain Parametric Identification

## **Processing**

On a windowed vector of identification data.

Correlation function

$$\hat{R}_{u}^{N}(\tau) = \frac{1}{N} \sum_{t=1}^{N} u(t) u(t-\tau) , \ \tau \in [-\gamma, \gamma]$$
 (1)

## **Processing**

On a windowed vector of identification data.

Correlation function

$$\hat{R}_{u}^{N}(\tau) = \frac{1}{N} \sum_{t=1}^{N} u(t) u(t-\tau), \ \tau \in [-\gamma, \gamma]$$
 (1)

Estimation of the Spectrum

$$\hat{\Phi}_{u}^{N}(\omega) = \sum_{\tau = -\gamma}^{\gamma} W_{\gamma}(\tau) \hat{R}_{u}(\tau) e^{-J\omega\tau}$$
 (2)

## **Processing**

On a windowed vector of identification data.

Correlation function

$$\hat{R}_{u}^{N}(\tau) = \frac{1}{N} \sum_{t=1}^{N} u(t) u(t-\tau) , \ \tau \in [-\gamma, \gamma]$$
 (1)

Estimation of the Spectrum

$$\hat{\Phi}_{u}^{N}(\omega) = \sum_{\tau = -\gamma}^{\gamma} W_{\gamma}(\tau) \hat{R}_{u}(\tau) e^{-J\omega\tau}$$
 (2)

Calculate estimations for  $\hat{\it R}^{N}_{yu}$  ,  $\hat{\Phi}^{N}_{yu}$  ,  $\hat{\it R}^{N}_{y}$  , and  $\hat{\Phi}^{N}_{y}$ 

## **Processing**

Smoothed Estimate of Frequency Response

$$\hat{G}_N(\omega) = \frac{\hat{\Phi}_{yu}^N(\omega)}{\hat{\Phi}_u^N(\omega)} \tag{3}$$

## **Processing**

Smoothed Estimate of Frequency Response

$$\hat{G}_N(\omega) = \frac{\hat{\Phi}_{yu}^N(\omega)}{\hat{\Phi}_u^N(\omega)} \tag{3}$$

Disturbance Spectrum

$$\hat{\Phi}_{v}^{N}(\omega) = \hat{\Phi}_{y}^{N}(\omega) - \frac{\left|\hat{\Phi}_{yu}^{N}(\omega)\right|^{2}}{\hat{\Phi}_{u}^{N}(\omega)} \tag{4}$$

## **Processing**

Smoothed Estimate of Frequency Response

$$\hat{G}_N(\omega) = \frac{\hat{\Phi}_{yu}^N(\omega)}{\hat{\Phi}_u^N(\omega)} \tag{3}$$

Disturbance Spectrum

$$\hat{\Phi}_{v}^{N}(\omega) = \hat{\Phi}_{y}^{N}(\omega) - \frac{\left|\hat{\Phi}_{yu}^{N}(\omega)\right|^{2}}{\hat{\Phi}_{u}^{N}(\omega)} \tag{4}$$

Coherence Spectrum

$$\kappa = \sqrt{\frac{\left|\hat{\Phi}_{yu}^{N}(\omega)\right|^{2}}{\hat{\Phi}_{v}^{N}(\omega)\hat{\Phi}_{u}^{N}(\omega)}}\tag{5}$$

Preliminaries

## Problem setup

#### Goals

- 1. Obtain an estimate of the frequency response  $\hat{G}(e^{j\omega})$
- 2. Obtain the coherence spectrum  $\kappa$

## Problem setup

#### **Problem**

- 1. Correlation between inputs and outputs due to feedback!!
- 2. Controller tracks the set-point: no p.e.

Preliminaries
Non-parametric identification in the frequency domain
Non-parametric closed-loop identification in the frequency domain

Parametric Identification

## Problem setup

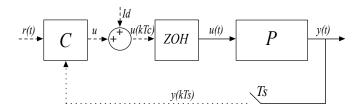

#### Solution

- 1. Use a "bad" controller: only stabilization
- 2. Add an exiting input after the controller
- 3. Use direct input to the plant to perform identification

## Problem setup

### Solution

- 1. Use a "bad" controller: only stabilization
- 2. Add an exiting input after the controller
- 3. Use direct input to the plant to perform identification

### Overview

#### Methods

- 1. Least-squares
- 2. Weighted least-squares
- 3. Recursive least-squares

## Overview

#### Methods

- 1. Least-squares
- 2. Weighted least-squares
- 3. Recursive least-squares

### Structures

- 1. ARX
- 2. ARMAX
- 3. ARIMAX
- 4. NARMAX
- 5. . . .

Non-parametric identification in the frequency domain Non-parametric closed-loop identification in the frequency domain

Parametric Identification

### Overview

## Subspace methods in the time domain

- 1. Give a state-space representation of the system
- 2. Less sensitive to measurement noise
- 3. Complicated algorithms
- 4. Often give unstable models
- 5. See N4SID (exists in Matlab)

Preliminaries
Non-parametric identification in the frequency domain
Non-parametric closed-loop identification in the frequency domain

### Subspace methods in the frequency domain

- 1. Give a state-space representation of the system
- 2. Less sensitive to measurement noise
- 3. Complicated algorithms using samples of the frequency response
- 4. Toolboxes for Matlab exist

### System Identification

Preliminaries

Non-parametric identification in the frequency domain

Non-parametric closed-loop identification in the frequency domain

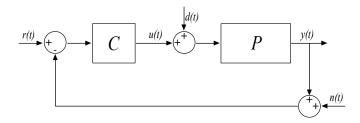

Parametric Identification

### Loop-Shaping

Open-loop vs closed-loop specifications

Compensators

#### Overview

#### Main ideas

- 1. Look to design a controller C to satisfy closed-loop specifications
- 2. Convert closed-loop specifications into constrains on the open-loop gain  $G_0 = CP$
- 3. Obtain the plant Bode diagram and shape  $G_0$  starting from C=1
- 4. "Add" compensators until desired shape is achieved

#### System Identification

Preliminaries

Non-parametric identification in the frequency domain

Non-parametric closed-loop identification in the frequency domain

Parametric Identification

## Loop-Shaping

Open-loop vs closed-loop specifications

Compensators

## Stability

Given cross-over frequency  $w_c$  the phase must be above -180 degrees. The distance between the phase of  $G_0(j\omega)$  and -180 degrees is called the phase-margin.

## Stability

Given cross-over frequency  $w_c$  the phase must be above -180 degrees. The distance between the phase of  $G_0(j\omega)$  and -180 degrees is called the phase-margin.

#### Overshoot

Larger phase margins generally corresponds to a smaller overshoot for the step response of the closed-loop system.

## Stability

Given cross-over frequency  $w_{\mathcal{C}}$  the phase must be above -180 degrees. The distance between the phase of  $G_0(J\omega)$  and -180 degrees is called the phase-margin.

#### Overshoot

Larger phase margins generally corresponds to a smaller overshoot for the step response of the closed-loop system.

## Reference tracking

A sufficient condition to track a reference with an error at least  $k_t\ll 1$  times smaller than the reference over a frequency range  $[0,\omega_t]$  is given by:

$$\left|G_0(j\omega)\right| \ge \frac{1}{k_t} + 1, \ \forall \omega \in [0, \omega_t]$$
 (6)

### Disturbance rejection

A sufficient condition to attenuate a disturbance at the output at least  $k_d \ll 1$  times over a frequency range  $[0, \omega_d]$  is given by:

$$\left|G_0(j\omega)\right| \ge \frac{\left|P(j\omega)\right|}{k_d} + 1, \ \forall \omega \in [0, \omega_d]$$
 (7)

### Disturbance rejection

A sufficient condition to attenuate a disturbance at the output at least  $k_d \ll 1$  times over a frequency range  $[0, \omega_d]$  is given by:

$$\left|G_0(j\omega)\right| \ge \frac{\left|P(j\omega)\right|}{k_d} + 1, \ \forall \omega \in [0, \omega_d]$$
 (7)

### Noise rejection

A sufficient condition to attenuate the measurement noise at the output at least  $k_n \ll 1$  times over a frequency range  $[\omega_n, \infty)$  is given by:

$$\left| G_0(j\omega) \right| \le \frac{k_n}{k_n + 1}, \ \forall \omega \in [\omega_n, \infty)$$
 (8)
